Report Documentation Page				Form Approved OMB No. 0704-0188	
Public reporting burden for the collection of information is estimated to average 1 hour per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing this burden, to Washington Headquarters Services, Directorate for Information Operations and Reports, 1215 Jefferson Davis Highway, Suite 1204, Arlington VA 22202-4302. Respondents should be aware that notwithstanding any other provision of law, no person shall be subject to a penalty for failing to comply with a collection of information if it does not display a currently valid OMB control number.

The Nanotechnology Challenge

“The Nanoworld is a weird borderland between individual molecules and the macroworld.”

Scientific American, 9/01

Too Many Opportunities: Where do we start?

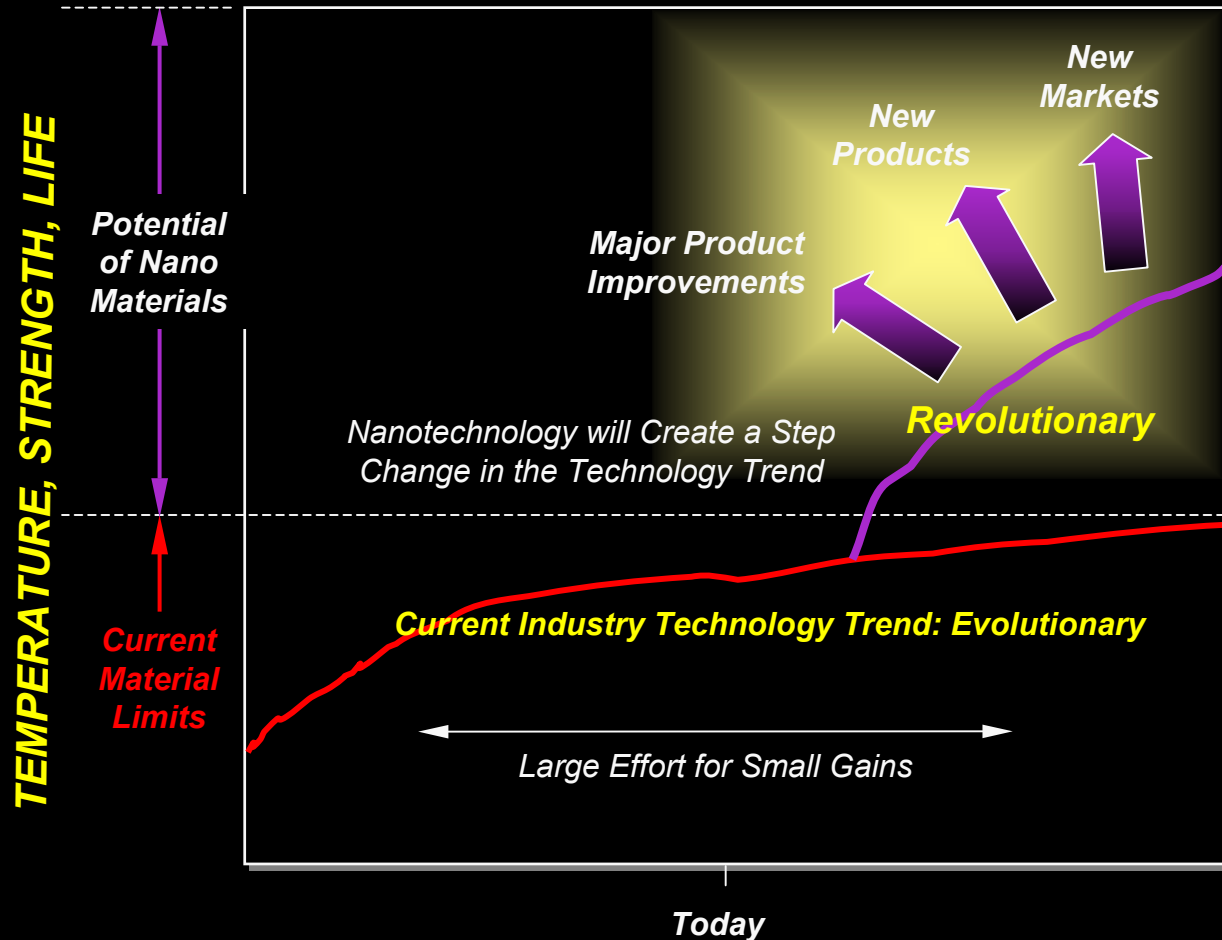

GE Technology...

- Saving Energy & the Environment
 - GE Aircraft Engines, GE Power Systems, GE Specialty Materials, GE Industrial Systems, GE Transportation
- Household Innovations
 - GE Consumer Products, GE Plastics
- The Future of Healthcare
 - GE Medical Systems

Why is GE Investing in Nanotechnology?

Aircraft Engines

Higher Thrust to Weight Ratio Engines

Land Based Turbines

Higher Efficiency Turbines

Medical Systems

Increased Diagnostic Speed for Medical Systems

All of the GE Businesses will benefit from the current investments being made in nanomaterials and nanotechnology

NanoMaterials

Nanotubes & Nanowires Platform

Leverage existing & invent novel materials in targeted application areas

Magnetic Nano-Particles Platform

Develop expertise in functionalized magnetic nanoparticles via contrast agents for MRI

NanoComposites

NanoStructures in Metals & Ceramics Platform

Develop fundamental structure-property relationships to design novel structural materials

ODS Alloys

Thermal Spray

EB-PVD

Ordered NanoStructures

Hybrid Materials Platform

Exploit self-assembly to engineer complex organic/inorganic systems

Ceramics Platform

Leverage biomimetic syntheses to produce high toughness, high T structural ceramics

Soft Lithography, Micro-casting
(0.1-1mm)

Field Induced, Sol-gel
(1-10 μ m)

Surfactant / Polymer Based Synthesis
(~10 nm)

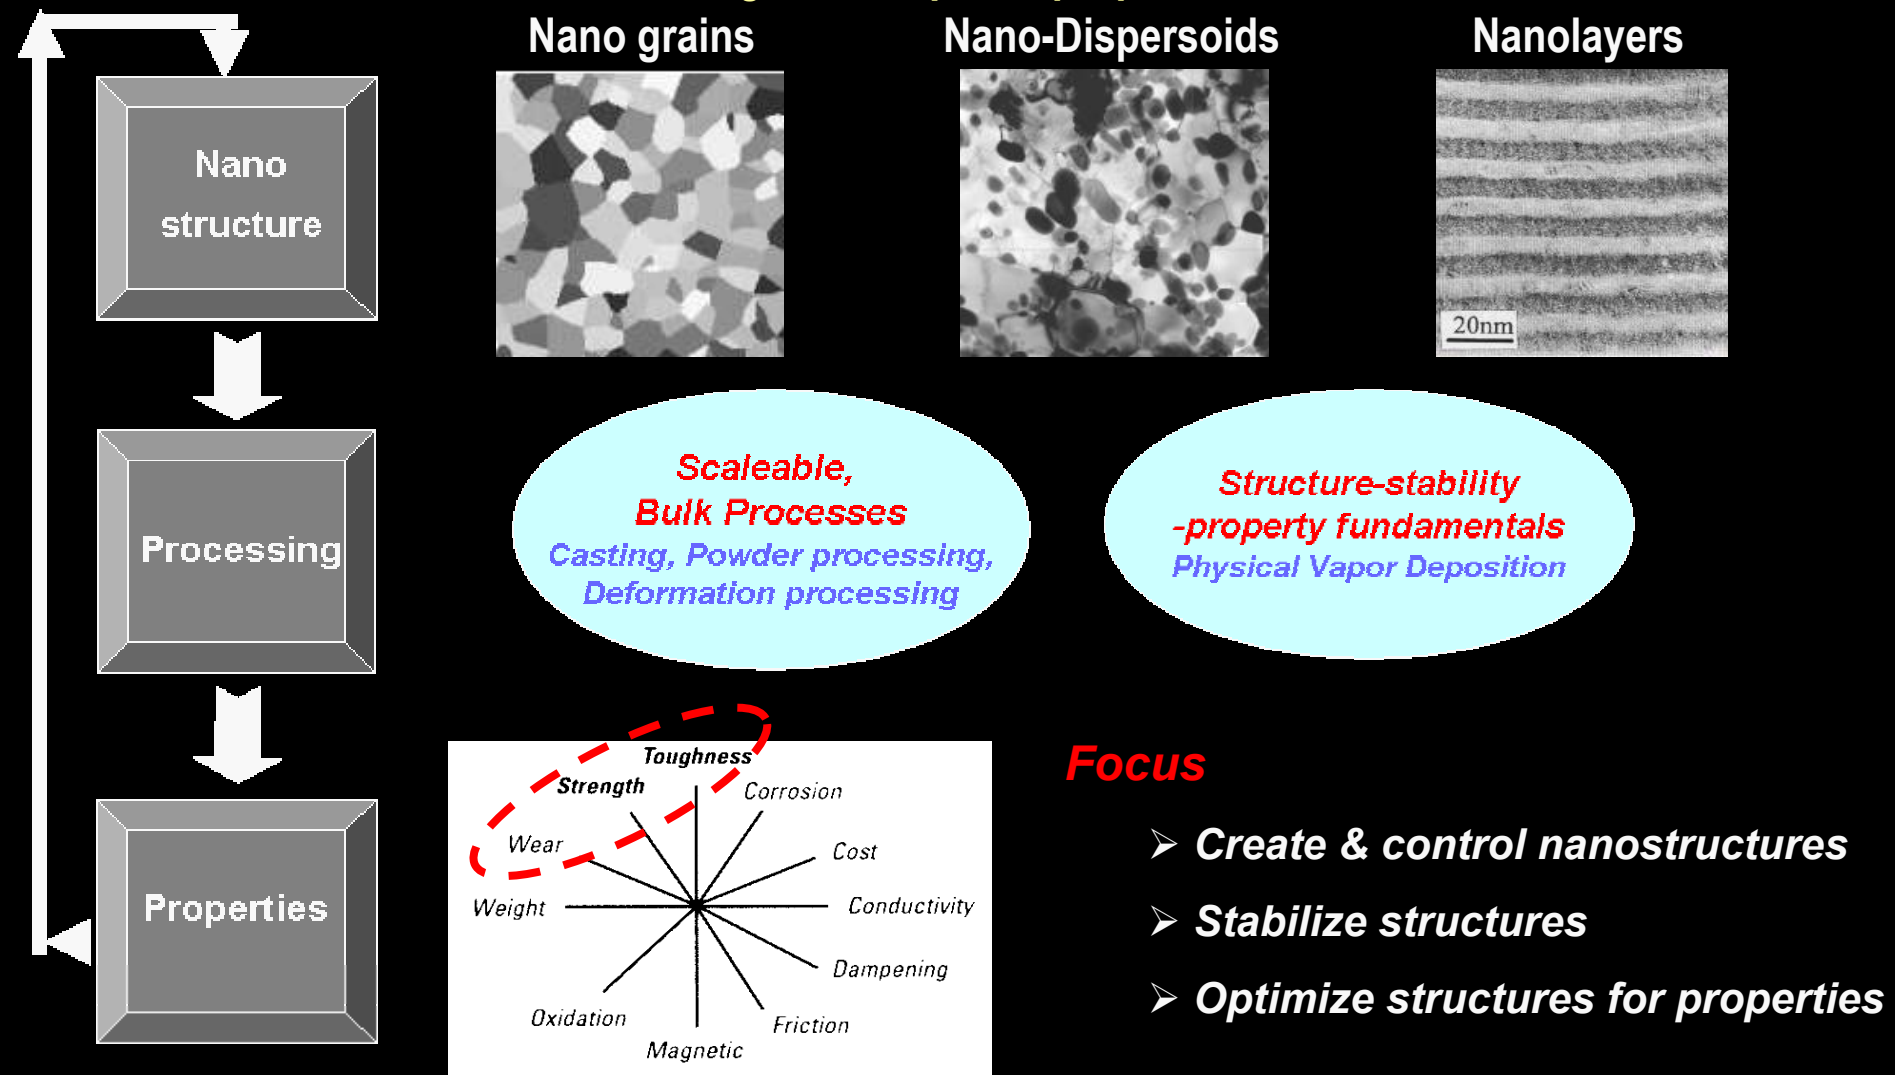

Broad Based Materials Foundation

Nanostructured Metallic Systems

Develop fundamental structure-property relationship to design nanostructural materials & coatings with superior properties

Opportunities for exceptional stability & strength enhancement in metallic materials

Strengthening Mechanisms

Effect of Microstructural Scale

Effect of Dispersoid Reinforcement

Order of magnitude increase in strength over micron size predicted

- Issues:**
- Dislocation source saturation at nano-scale
 - Competition between strengthening from nano-scale vs. weakening by gb sliding
 - Thermal stability

**Single phase Nanocrystalline Materials**

- Large grains: many dislocations in pile-up → continuum theory of Hall-Petch works ($\sigma \propto d^{-1/2}$)
- Small grains: question is how many dislocations in pile-up?

**# of dislocations in pile-up
(using circular pile-up model)**

$$n = \left(\frac{\tau^*}{G} \right)^{1/2} \left(\frac{D}{b} \right)^{1/2}$$

~20-100 nm grain size: dislocations cross gbs one at a time & there is no pile-up (dislocation source saturation)

→ Easier to deform by Coble creep instead of dislocation glide

Layered Structures

Large h ($\lambda/2$)

Hall-Petch behavior - dislocation pile-ups at interface

Small h ($\lambda/2$)

Plastic flow by single dislocations moving by bowing within layers

Misfit dislocations in multilayers

Leaves misfit dislocations at interface

Dislocation-particle interactions

Orowan mechanism

Interfacial pinning mechanism

Issues:

- Thermally assisted climb at high T_s
- Microstructural stability at high T_s and high stresses
- Dispersoid volume fraction: Tradeoff for strengthening vs. ductility ?
What is needed for wear resistance?

Dispersoid Reinforcement - Grain Boundary Pinning

Grain Size (D) vs. Mean Free Path (Λ)
Between 2nd Phase Particles (d)

$D < \Lambda$

$D = \Lambda$

$D > \Lambda$

INCREASING DISPERSOID CONTENT →

Zener Pinning

Issues:

- Microstructural stability at high T s and high stresses
- Dispersoid volume fraction: Tradeoff for strengthening vs. ductility? What is needed for wear resistance?

Dispersoid Structures

Nano strengthening mechanisms can be used to leverage superior wear properties while retaining higher toughness

$$\text{Wear} = f(H, K_c)$$

$$H = \text{Hardness: } f(\lambda^{-1/2})$$

$$K_c = \text{Fracture toughness: } f(\lambda/d)$$

- *Higher hardness through lower mean free spacing λ*
- *Better toughness through fine particle size d , and d/λ ratio*

7 X reduction in wear by reducing λ from 0.4 to 0.15 microns

High wear resistance and toughness obtained by dispersoid structure

- **Strength (nanocrystalline metals) >> Strength (conv. metals)**
- **Ductility (nanocrystalline metals) << Strength (conv. metals)**
- **Hardness & wear resistance = strong function of g_s**
- **Modulus & thermal expansion = mostly grain-size independent**
- **Softening at ~ 5-50 nm grain size due to grain boundary sliding + diffusional creep**
- **Properties = strong function of processing**

Parameters influencing strength

- Layer spacing (λ)
 - Large spacings: Hall-Petch behavior (Dislocation pile-up model)
 - Low spacings: individual dislocation motion in layers
 - Very low spacings: superlattice strength (\gg harder component)
- Miscibility
- Slip systems (Crystal structure)
- Shear modulus
- Coherency strains (δ)

- Metal/ceramic multilayers show good combination of toughness + hardness
=> wear application
- Significant strengthening observed in nanolayered structures

	Dispersed Structures			Layered Structures			
Mechanisms/Factors	Strength	Creep	Thermal Stability	Strength	Creep	Thermal Stability	Parameters
Dislocation-particle interaction (Orowan effect, attachment, detachment, shear)	√	√					Particle size, spacing, distribution
GB-particle interaction (Zener pinning)	√	√					Particle size, spacing, distribution
Hall-Petch effect (Dislocation-boundary interaction)	√			√			Matrix grain size /layer spacing
Grain boundary sliding	√	√	√				Matrix grain size & aspect ratio
Microstructural Evolution	√	√	√	√	√	√	Thermo/kinetics
Interfacial energy		√	√		√		
Dislocation sources & generation stresses	√?			√			Matrix grain size /layer spacing
Dislocation substructure	√						Matrix grain size
Koehler Stress or Image Stress				√			Modulus mismatch
Interface coherency	√			√			Crystallographic mismatch
GB segregation of solutes & particles	√	√	√				
Miscibility	√		√	√		√	Solubility/diffusivity/ Thermodynamics

GOAL: Differentiate mechanisms giving rise to unique properties

Stability

Predictive tool development

- Phase Field
- Analytical

§ Grain growth
§ Alloying effects on stability
§ Thermal stability of layered structures
§ Exptl. validation

Atomistics

Strengthening mechanism prediction & fundamental quantities

- Embedded Atom Method
- Analytical

§ Interfacial strength
§ Dislocation-interface interaction mechanisms
§ Exptl. validation

Mechanical Behavior

Deformation behavior understanding

- Analytical
- Numerical

§ Nano-structural effects on deformation behavior
§ HT creep mechanisms in nanostructures

Modeling across multiple-length scales for structure-to-property understanding in metallic nanostructures

Physical Vapor Deposition

Produce controlled & tailored systems for structure-property understanding
Learn what controls grain growth; high T stability; gb sliding

Objective: Develop technology for dispersion of nano oxides in molten metal castings.

Opportunity

- Lower cost
- Higher strength
- Higher T capability

Technical Barriers:

- *Wettability & reactivity at particle/matrix interface*
- *Dispersion, initially and during solidification*

Power feedstock

Coat feedstock

Melt and Solidified casting

Agglomerated n-yttria + detached n-oxides

Dispersion Technologies

- **Coatings**
- Active Elements

Initial results showed some wetting and dispersion of nano-oxides in molten metal

Bulk Amorphous Phase

- Non-crystalline
- Isotropic
- No segregation
- Producible in bulk by conventional methods

+ Heat Treat =

Nano-crystalline Materials

- Ultra-fine grains
- Uniform distribution
- Nano-particles
- Varieties of primary/second phases possible

Powder Deposition, Consolidation

- High Strength
- Corrosion Resistant
- Damage tolerant

Nanostructured Fe-Based Materials

Nanostructures created in Fe-based alloys exhibit hardness 4x conventional alloys

Layered Structures by PVD

(50nm Cu/50nm Mo) \times 50

(5nm Cu/5nm Mo) \times 50

(50nm Cu/5nm Mo) \times 50

(100nm Cu/50nm Mo) \times 50

- **Controlled nanolayer systems can be fabricated by PVD**
- **Experiments planned to study variables affecting strength in layered systems**

Cu-Mo multilayer mounted UD 6903b

500 nm

**Thermal
grooving
of GB**

**Need predictive model
for thermal stability
from microstructural
variables**

Stability Diagrams

- Significant increase in hardness demonstrated in nano multilayers
- ~60% drop in strength for unstable spheroidized structure

Cu-Mo

800°C HT

**Kinetic Model:****Evolution of groove depth 'd' with time 't' :****Thermal stability of Multilayers :****→ Instability mechanism: thermal grooving**

$$d = (0.78) (\tan \beta) [(\Omega^{4/3} D_{\text{int}}) \frac{\gamma_{\text{int}}}{kT}]^{1/4} t^{1/4}$$

For a (50 nm/50 nm) Cu-Mo multilayer, time taken for grooving :

T= 800°C → time ~ 0.006 h

T= 500°C → time ~ 0.16 h

T= 300°C → time ~ 12 h

Refinements Needed:

- **Interface Diffusivity of Cu-Mo**
- **GBE/interfacial energies dependence with T**

- **HT & TEM to determine groove angle in Cu-Mo multilayers**
- **Refinement of kinetics model needed**

Hazzledine & Rao

Dislocation vs. Interface in Nanolayers

[110] Screw Disln in Cu
Dislocation simulation in lattice

Dislocation motion under applied stress in Ni lattice

Literature data on layered systems

GOAL: Prediction of strength in nanolayered structures

Nano ODS:as deposited

Nano ODS: Annealed

Conv. P/M ODS

- Nano ODS structures over 2 times harder than conventional ODS structures

- Nano ODS stronger than conventional ODS at all temperatures

Nano ODS has ~2-3x greater hardness (strength) than conventional material

Mechanically Alloyed Nano-Al

HT

RT Hardness vs. Annealing Temperature & Time

Grain Boundary (GB) Pinning by Particles: Zener Pinning?

Early stages of understanding of potential stability mechanisms in Nano-Al

- *Crystal structure & orientation relationship*
- *Stability*

Initial modeling efforts: Ni @ 800 °C

Grain growth model in place for predicting thermal stability of nano-structures

Grain growth in pure Ni: Model vs. Validation

T (°C) / t (min)	Grain Size (μ) Starting GS = 16.4 μ	
	Model	Expt
800/30	35.5	35.1
800/60	44.2	37.9
1000/30	102.1	91.9

Model solute
Diffusivity = $\frac{1}{2}$ (self diffusion of Ni)

Norm. time = 5000 (0.3 s)

Norm. time = 400 (0.02 s)

1μm

Solute Segregation (at%)

$\tau=0$: Grain = 5 % GB = 5 %
 $\tau=400$: Grain \approx 1 % GB \approx 16 %
 $\tau=5000$: Grain \approx 3 % GB \approx 18 %

Model predicts significant grain growth retardation with 20% solute at gb
Experimental validation planned with PVD structures

Wear resistance = f (H, K_c)

H = Hardness: $f(\lambda^{-1/2})$

K_c = Fracture toughness: $f(\lambda/d)$

Thermal Sprayed WC/Co Coating
